GENERAL WARNING

1.1 PLEASE READ BEFORE USING THIS MANUAL

- This manual is part of the product and should be kept near the instrument for easy and quick reference.
- The instrument shall not be used for purposes different from those described hereunder. It cannot be used as a safety device.
- Check the application limits before proceeding.

1.2 SAFETY PRECAUTIONS

- Check the supply voltage is correct before connecting the instrument.
- Do not expose to water or moisture: use the controller only within the operating limits avoiding sudden temperature changes with high atmospheric humidity to prevent formation of condensation
- Warning: disconnect all electrical connections before any kind of maintenance.
- Fit the probe where it is not accessible by the End User. The instrument must not be opened.
- In case of failure or faulty operation send the instrument back to the distributor or to "Dixell S.p.A." (see address) with a detailed description of the fault.
- Consider the maximum current which can be applied to each relay (see Technical Data).
- Ensure that the wires for probes, loads and the power supply are separated and far enough from each other, without crossing or intertwining.
- In case of applications in industrial environments, the use of mains filters (our mod. FT1) in parallel with inductive loads could be useful.

The **XM670K/XM679K** are high level microprocessor based controllers for multiplexed cabinets suitable for applications on medium or low temperature. It can be inserted in a LAN of up to 8 different sections which can operate, depending on the programming, as stand alone controllers or following the commands coming from the other sections. The **XM670K/XM679K** are provided with 6 relay outputs to control the solenoid valve, defrost - which can be either electrical or hot gas - the evaporator fans, the lights, an auxiliary output and an alarm output and with one output to drive **pulsed electronic expansion valves** (**only XM679K**). The devices are also provided with four probe inputs, one for temperature control, one to control the defrost end temperature of the evaporator, the third for the display and the fourth can be used for application with virtual probe or for inlet/outlet air temperature measurement. 6.CONTROLLING LOADS

THE SOLENOID VALVE

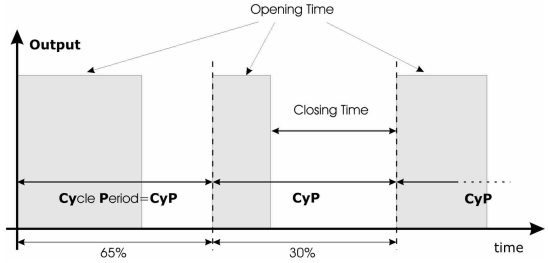
The regulation is performed according to the temperature measured by the thermostat probe that can be physical probe or virtual probe obtained by a weighted average between two probes (see parameters table description) with a positive differential from the set point. If the temperature increases and reaches set point plus differential the solenoid valve is opened and then it is closed when the temperature reaches the set point value again.

In case of fault in the thermostat probe the opening and closing time of solenoid valve is configured by "**Con**" and "**CoF**" parameters.

6.1STANDARD REGULATION AND CONTINUOUS REGULATION

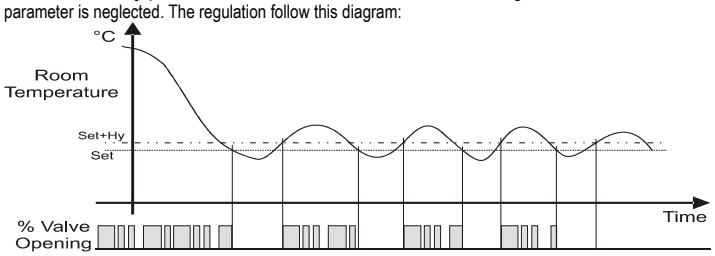
The regulation can be performed in two ways: the goal of the first way (**standard regulation**) is reaching the best superheat via a classic temperature regulation obtained using hysteresis. The second way, permits to use the valve to realise an high performance temperature regulation with a good factor of superheat precision. **This second possibility, it can be used only in centralized plants and it is available only with electronic expansion valve** by selecting **CrE=Y** parameter.

In any case, the regulation is performed via PI regulator that gives the opening percentage to the valve via PWM modulation explained as follow. Opening percentage is obtained from average of Opening Time respect to **CyP** time period like following diagram:

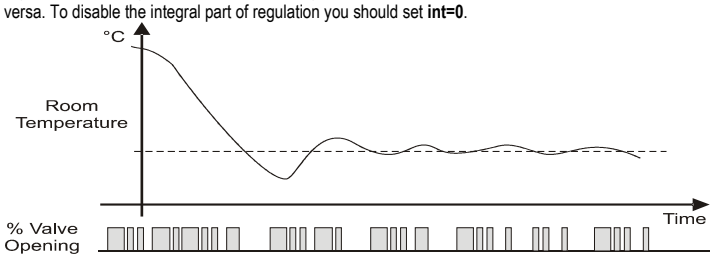


With opening percentage we mean percentage of cycle period where valve is open. For example, if **CyP=6s** (standard value) by saying: "The valve is opened at **50%**"; this means that the valve is opened for **3s** during cycle period.

First kind of regulation:
In this case, the **Hy** parameter is the differential for standard ON/OFF regulation. In this case the **int** parameter is neglected. The regulation follow this diagram:



Second kind of regulation – Continuous regulation (only XM679K):
In this case, the **Hy** parameter is the proportional band of PI in charge of room temperature regulation and we advise to used at least **Hy=5.0°C/10°F**. The **int** parameter is the integral time of the same PI regulator. Increasing **int** parameter the PI regulator become slow in reaction and of course is true vice versa. To disable the integral part of regulation you should set **int=0**.



6.2DEFROST

Defrost starting
In any case, the device check the temperature read by configured defrost probe before starting defrost procedure, after that:

- (If RTC is present)Two defrost modes are available through the "**tdF**" parameter: defrost with electrical heater and hot gas defrost. The defrost interval is controlled by parameter "**EdF**": (EdF = rtc) defrost is made in real time depending on the hours set in the parameters **Ld1..Ld6** in workdays and in **Sd1…Sd6** on holidays; (EdF = in) the defrost is made every "**IdF**" time;
- defrost cycle starting can be operated locally (manual activation by means of the keyboard or digital input or end of interval time) or the command can come from the Master defrost unit of the LAN. In this case the controller will operate the defrost cycle following the parameters it has programmed but, at the end of the drip time, will wait that all the other controllers of the LAN finish their defrost cycle before to re-start the normal regulation of the temperature according to **dEM** parameter;
- Every time any of the controller of the LAN begin a defrost cycle it issue the command into the network making all the other controllers start their own cycle. This allows a perfect synchronisation of the defrost in the whole multiplexed cabinet according to **LMd** parameter;
- Selecting **dPA** and **dPb** probes and by changing the **dtP** and **ddP** parameters the defrost can be started when the difference between dPA and dPb probes is lower than dtP for all ddP time. This is useful to start defrost when a low thermal exchange is detected. If **ddP=0** this function is disabled;

Defrost ending

- When defrost is started via rtc, the maximum duration of defrost is obtained from **Md** parameter and the defrost end temperature is obtained from **dtE** parameter (and **dtS** if two defrost probes are selected).
- If **dPA** and **dPb** are present and **d2P=y** the instrument stops the defrost procedure when **dPA** is higher than **dtE** temperature and **dPb** is higher than **dtS** temperature;

At the end of defrost the drip time is controlled through the "**Fdt**" parameter.

6.3FANS

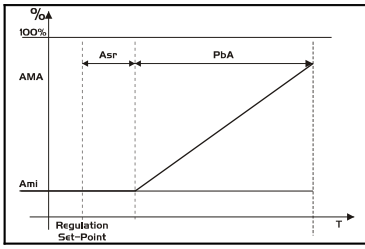
CONTROL WITH RELAY

The fan control mode is selected by means of the "**FnC**" parameter:

C-n = running with the solenoid valve, OFF during the defrost;
C-y = running with th1e solenoid valve, ON during the defrost;
O-n = continuous mode, OFF during the defrost;
O-y = continuous mode, ON during the defrost;

An additional parameter "**FSt**" provides the setting of temperature, detected by the evaporator probe, above which the fans are always OFF. This can be used to make sure circulation of air only if his temperature is lower than set in "**FSt**".

CONTROL WITH ANALOG OUTPUT (if present)

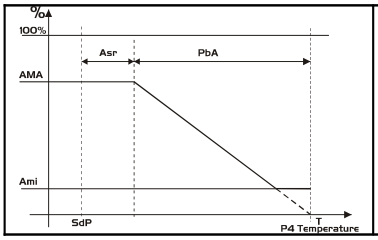


The modulating output (**trA=rEG**) works in proportional way (excluding the first **AMt** seconds where the fans speed is the maximum). The regulation set point is relative to regulation set point and is indicated by **ASr,** the proportional band is always located above **SET+ASr** value and its value is **PbA**. The fan are at minimum speed (**AMi)** when the temperature read by fan probe is **SET+ASr** and the fan is at maximum speed (**AMA**) when the temperature is **SET+ASr+PbA**.

6.4ANTI SWEAT HEATERS (IF PRESENT)

This control is performed when **trA=AC.** In this case, there is two way to control the anti-sweat heaters:

- Without real dew-point information: in this case the default value for dew-point is used (SdP parameter).
- Receiving dew-point from XWEB5000 system: the SdP parameter is overwrote when valid value for dew-point is received from XWEB.



The P4 probe is used to perform the regulation and it should be placed on the showcase glass. In case of P4 error or if P4 is absent the output is at **AMA** value for the **AMt** time then the output is at 0 value for the time **255-AMt** time performing a simple PWM modulation.

6.5AUXILIARY OUTPUT

The auxiliary output is switch ON and OFF by means of the corresponding digital input or by pressing and releasing the down arrow key.

8.DIGITAL INPUTS

The XM600 series can support up to 3 free of voltage contact configurable digital inputs (depending on the models). They are configurable via i#F parameter

8.1GENERIC ALARM (EAL)

As soon as the digital input is activated the unit will wait for "**did**" time delay before signalling the "**EAL**" alarm message. The outputs status don't change. The alarm stops just after the digital input is de-activated.

8.2SERIOUS ALARM MODE (BAL)

When the digital input is activated, the unit will wait for "**did**" delay before signalling the "**BAL**" alarm message. The relay outputs are switched OFF. The alarm will stop as soon as the digital input is de-activated.

8.3PRESSURE SWITCH (PAL)

If during the interval time set by "**d#d**" parameter, the pressure switch has reached the number of activation of the "**nPS**" parameter, the "**CA**" pressure alarm message will be displayed. The compressor and the regulation are stopped. When the digital input is ON the compressor is always OFF. **If the nPS activation in the d#d time is reached, switch off and on the instrument to restart normal regulation.**

8.4DOOR SWITCH INPUT (dor)

It signals the door status and the corresponding relay output status through the "**odc**" parameter: **no** = normal (any change); **Fan** = Fan OFF; **CPr** = Compressor OFF; **F_C** = Compressor and fan OFF. Since the door is opened, after the delay time set through parameter "**d#d**", the door alarm is enabled, the display shows the message "**dA**" and **the regulation restarts after rrd time.** The alarm stops as soon as the external digital input is disabled again. With the door open, the high and low temperature alarms are disabled.

8.5START DEFROST (DEF)

It executes a defrost if there are the right conditions. After the defrost is finished, the normal regulation will restart only if the digital input is disabled otherwise the instrument will wait until the "**Mdf**" safety time is expired.

8.6RELAY AUX ACTUATION (AUS)

This function allows to turn ON and OFF the auxiliary relay by using the digital input as external switch.

8.7RELAY LIGHT ACTUATION (LIG)

This function allows to turn ON and OFF the light relay by using the digital input as external switch.

8.8REMOTE ON/OFF (ONF)

This function allows to switch ON and OFF the instrument.

8.9KIND OF ACTION (HTR)

This function allows to change the kind of regulation from cooling to heating and vice versa.

8.10FHU – NOT USED

This function allows to change the kind of regulation from cooling to heating and viceversa.

8.11ENERGY SAVING INPUT (ES)

The Energy Saving function allows to change the set point value as the result of the SET+ HES (parameter) sum. This function is enabled until the digital input is activated.

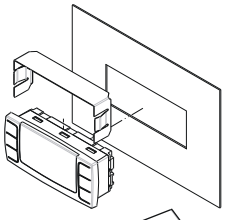
8.12CONFIGURABLE INPUT - HOLIDAY FUNCTION (HDY)

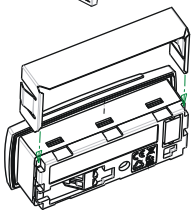
In Holiday function Energy saving and defrost cycles follow holiday times. **(Sd1…Sd6)**

8.13DIGITAL INPUTS POLARITY

The digital inputs polarity depends on "**I#P**" parameters: **CL** : the digital input is activated by closing the contact; **OP** : the digital input is activated by opening the contact.

9.INSTALLATION AND MOUNTING





The **CX660 keyboard** shall be mounted on vertical panel, in a 29x71 mm hole, and fixed using the special bracket supplied. The temperature range allowed for correct operation is 0÷60 °C. Avoid places subject to strong vibrations, corrosive gases, excessive dirt or humidity. The same recommendations apply to probes. Let air circulate by the cooling holes.

10.ELECTRICAL CONNECTIONS

XM670K/XM679K is provided with screw terminal block to connect cables with a cross section up to 1,6 mm^2 for all the low voltage connection: the RS485, the LAN, the probes, the digital inputs and the

keyboard. Other inputs, power supply and relays connections are provided with Faston connection (5.0 mm). Heat-resistant cables have to be used. Before connecting cables make sure the power supply complies with the instrument's requirements. Separate the probe cables from the power supply cables, from the outputs and the power connections. Do not exceed the maximum current allowed on each relay, in case of heavier loads use a suitable external relay. **N.B.** Maximum current allowed for all the loads is 16A.

10.1PROBE CONNECTIONS

The probes shall be mounted with the bulb upwards to prevent damages due to casual liquid infiltration. It is recommended to place the thermostat probe away from air streams to correctly measure the average room temperature. Place the defrost termination probe among the evaporator fins in the coldest place, where most ice is formed, far from heaters or from the warmest place during defrost, to prevent premature defrost termination.

11.RS485 SERIAL LINE

XM670K/XM679K is provided of a direct RS485 connection that allow the unit, to be linked to a network line **ModBUS-RTU** compatible with all **dixell** monitoring system.

12.USE OF THE PROGRAMMING "HOT KEY"

The XM units can UPLOAD or DOWNLOAD the parameter list from its own E2 internal memory to the **"Hot Key"** and vice-versa through a TTL connector.

12.1DOWNLOAD (FROM THE "HOT KEY" TO THE INSTRUMENT)

1. Turn OFF the instrument by means of the ON/OFF key ,insert the **"Hot Key"** and then turn the unit ON.
2. Automatically the parameter list of the **"Hot Key"** is downloaded into the controller memory, the "**doL**" message is blinking. After 10 seconds the instrument will restart working with the new parameters. At the end of the data transfer phase the instrument displays the following messages: "**end**" for right programming. The instrument starts regularly with the new programming. "**err**" for failed programming. In this case turn the unit off and then on if you want to restart the download again or remove the "**Hot key**" to abort the operation.

12.2UPLOAD (FROM THE INSTRUMENT TO THE "HOT KEY")

1. When the XM unit is ON, insert the "**Hot key**" and push ▭ key; the **"uPL"** message appears.
2. The UPLOAD begins; the "**uPL**" message is blinking.
3. Remove the **"Hot Key".**
   At the end of the data transfer phase the instrument displays the following messages:
   "**end** " for right programming.
   "**err**" for failed programming. In this case push "SET" key if you want to restart the programming again or remove the not programmed "**Hot key**".
